# displaying object
copepods

```

1. Visualizing differences across sites in major taxon abundance

a.

- x-axis: site
- y-axis: log + 1 transformed average ostracod abundance/L
- geometry to represent average abundance/L: `geom_jitter()`
- geometry to represent medians: `stat_summary()` with a visually distinct point

b.

```
# creating new object from clean aquatic inverts
ostracods <- aq_ins_clean |>
  # filter to only include ostracods
  filter(taxon == "ostracod") |>
  # create log + 1 transformed abundance column
  mutate(log_ave_lit = log(ave_lit + 1))
```

```
# display 10 random rows from data frame
slice_sample(ostracods, n = 10)
```

```
# A tibble: 10 x 24
```
